PATIENT NAME TATE, KEVIN
D.O.B. 08/03/1978
PATIENT # 1024
DATE OF SERVICE 7/29/2022 9:47:16 AM
REF. PHYSICIAN KOPACH, ALEXANDR MD

MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: Left shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture or suspicious lesion. No os acromiale or intra-articular loose body. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

There is a low-lying acromion also impinging on predominantly supraspinatus, with a broad surface fraying as well as more articular surface fibrillation at the anterior insertional fibers. There are 6 image 14. Acromioclavicular osteoarthritis with capsular sprain, as well as sprain of coracohumeral and coracoacromial ligaments. Subacromial/subdeltoid bursitis.

Suspicion of anterior to slightly anterosuperior labral tear at approximate 2:00 axis. Series 6 images 7, 8.. Mild subscapularis tendinopathy. Intact superior glenohumeral ligament. Mild proximal biceps tendinopathy with peritendinous fluid. Intact biceps labral anchor complex.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No significant effusion. No intra-articular loose body.

IMPRESSION:

1. Suggestive shoulder impingement predominantly on the supraspinatus, with a broad surface fraying as well as more articular surface fibrillation at the anterior insertional fibers. There are 6 image 14. Acromioclavicular osteoarthritis with capsular sprain, as well as sprain of coracohumeral and coracoacromial ligaments. Subacromial/subdeltoid bursitis.
