Exam: MRI LEFT SHOULDER
Exam Date: 03/25/2022 9:05 AM
Accession: 21738

Patient Name: Jackson, Andrew
DOB: 05/25/1962
Gender: M
MRN: JacA4406

LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is an interstitial tear at the confluence of the supraspinatus and infraspinatus tendon insertions superimposed on supraspinatus, infraspinatus, and subscapularis tendinitis. There is thickening and edema of the subdeltoid/subacromial bursa with bursal fluid consistent with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is moderate acromioclavicular joint disease with capsular thickening and marginal osteophytes which exert mass-effect on the supraspinatus myotendinous junction. There is subacromial spurring and thickening of the coracoacromial ligament which contribute to rotator cuff impingement.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear of the superior glenoid labrum anterior to posterior (SLAP tear).

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Interstitial tear at the confluence of the supraspinatus and infraspinatus tendon insertions

superimposed on supraspinatus, infraspinatus, and subscapularis tendinitis. Evidence of rotator cuff impingement secondary to moderate acromioclavicular joint disease, subacromial spurring, and thickening of the coracoacromial ligament. Associated subdeltoid/subacromial bursitis.

Tenosynovitis of the extra-articular long head of the biceps tendon.

Tear of the superior glenoid labrum anterior to posterior (SLAP tear).
