Exam requested by:
MOHAN TRIPATHI MD
2001 MARCUS AVE., SUITE W170
LAKE SUCCESS NY 11042

**SITE PERFORMED: LHR ELMHURST
QUEENS BLVD**

SITE PHONE: (718) 544-5151

Patient: ACEVEDO, JOSEPH
Date of Birth: 10-28-1976
Phone: (718) 954-0072
MRN: 4331732R Acc: 1024630468
Date of Exam: 09-22-2022

EXAM: MRI RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Bilateral shoulder pain.

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was obtained on a 3T scanner according to standard protocol.

COMPARISON: None.

FINDINGS:

BONE MARROW: No fracture or avascular necrosis.

ACROMIOCLAVICULAR JOINT: Moderate to severe osteoarthritis with reactive edema in the distal clavicle and acromion. Significant capsular hypertrophy as well as osteophyte formation resulting in narrowing the subacromial space and mass effect the myotendinous junction of the supraspinatus suggesting subacromial impingement.

BURSITIS: Mild bursitis.

ROTATOR CUFF TENDONS: Rotator cuff tendinosis. There is a low-grade partial thickness tear of the supraspinatus tendon. Low to moderate grade intrasubstance delaminating partial thickness tear of the infraspinatus tendon coronal 20, sagittal 9. Low-grade intrasubstance partial thickness tear of the subscapularis tendon.

BICEPS: Mild tenosynovitis. No visualized tear. No subluxation or dislocation at the bicipital pulley.

GLENOHUMERAL JOINT: Mild osteoarthritis with mild cartilage thinning. No joint effusion or intra-articular bodies.

LABRAL LIGAMENOUS COMPLEX: Labrum is intact without pathology.

ROTATOR INTERVAL: Unremarkable.

CORACOACROMIAL AND CORACOCALVICULAR LIGAMENTS: Intact. No visualized tears.

MUSCLES: Normal signal characteristics and bulk without edema or atrophy.

QUADRILATERAL SPACE: Normal without masses.

IMPRESSION:

Rotator cuff tendinosis with low-grade partial thickness tears of the supraspinatus and subscapularis tendons and a low to moderate grade intrasubstance delaminating partial thickness tear of the infraspinatus tendon. No high-grade or full-thickness tendon tear.

Moderate to severe AC joint osteoarthritis with mild bursitis with findings suggesting subacromial impingement.
