PERVAIZ QURESHI, M.D.
79-09 B NORTHERN BLVD
JACKSON HEIGHTS, NY 11372

PATIENT: MATILDE ESPINDOLA LOPEZ
DOB: 09/20/1983
DOS: 12/03/2021
CHART #: 23943
EXAM: MRI OF THE LEFT ANKLE WITHOUT CONTRAST

HISTORY: Pain greater laterally.

COMPARISON: None.

Additional sanitizing / safety protocols recommended by the CDC were performed.

TECHNIQUE: Multiplanar MR imaging of the left ankle was performed without contrast on Hitachi open MRI unit.

Sagittal T1 and fat suppressed weighted images, axial proton density T1 and STIR weighted images and coronal STIR and T2 images of the ankle were obtained without IV contrast.

FINDINGS: The Achilles tendon is intact.

There is mild peritendinitis distally. Plantar fascia is unremarkable. Moderate edema and fluid is seen at the subtalar joint.

There is a small effusion seen at the tibiotalar joint. There is a prominent contusion over the distal fibula and hindfoot. A moderate posterior tibial tenosynovitis is seen. A tear is seen distally measuring 2 to 3 mm. There is no attenuation however.

Anterior tendon group is unremarkable. Peroneal ligaments are unremarkable as well.

Talar dome is intact. There is prominent contusion over the distal fibula and hindfoot. There is mild contusion over the medial malleolus.

Normal arch configuration is seen. The midfoot is unremarkable.

There appears to be some subtle bone bruising laterally at the distal fibula 2 to 5 cm above the joint line seen on image #10 of series #6.

DOS: 12/03/2021
CHART #: 23943
EXAM: MRI OF THE LEFT ANKLE WITHOUT CONTRAST
PAGE 2

IMPRESSION:

1. PROMINENT SOFT TISSUE CONTUSIONS ARE SEEN, WHICH ARE GREATER Laterally. THERE IS SOME SUBTLE BONE BRUISING AT THE DISTAL FIBULA AT THE ENDOSTEAL LOCATION.
2. THERE IS POSTERIOR TIBIAL TENOSYNOVITIS. A TEAR IS SEEN DISTALLY OF THE POSTERIOR TIBIAL TENDON.
3. MODERATE JOINT EFFUSION IS SEEN OF THE TIBIOTALAR JOINT, WHICH IS LIKELY REACTIVE.
4. MILD PERITENDINITIS ADJACENT TO THE DISTAL ACHILLES TENDON IS SEEN.

Thank you for referring this patient to us.
