MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: Left shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture or suspicious lesion. No os acromiale or intra-articular loose body. No significant AC joint arthrosis. No evidence of significant glenohumeral compartment arthritis and glenohumeral cartilage grossly intact.

Tendinosis posterior fibers of the supraspinatus. The infraspinatus tendons are normal. The subscapularis and teres minor tendon is normal. No evidence of muscle atrophy or fatty infiltration.

Focal hyperintense signal concerning for blunted tear inferior labrum 6:00 axis. Series 5 image 7, series 6 image 7. Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact.

No significant effusion. No subacromial/subdeltoid bursitis.

IMPRESSION:

1. Focal hyperintense signal concerning for blunted tear inferior labrum 6:00 axis. Series 5 image 7, series 6 image 7.
2. Supraspinatus tendinosis.

Thank you for this kind referral of this patient.
