

To: Davis, Gordon
Exam: MRI RIGHT SHOULDER
Exam Date: 06/29/2022 11:22 AM
Accession: 26540

Patient Name: Rosias, Bael
DOB: 03/16/1992
Gender: M
MRN: RosB5732

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There are linear interstitial tears of the distal supraspinatus and infraspinatus tendons superimposed on tendinitis. The subscapularis and teres minor tendons are intact.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact. There is lateral downsloping of the acromion and thickening of the coracoacromial ligament which contribute to rotator cuff impingement.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: No labral tear.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Linear interstitial tears of the distal supraspinatus and infraspinatus tendons superimposed on tendinitis. Evidence of rotator cuff impingement secondary to lateral downsloping of the acromion and thickening of the coracoacromial ligament.
