IDY LIANG, NP-C
5205 CHURCH AVENUE
BROOKLYN, NY 11203

PATIENT: LLOYD RYAN
DOB: 06/28/1936 DOS: 10/18/2022 CHART #: 4350
EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Shoulder pain, burning, stinging, limited range of motion.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

FINDINGS: There are subchondral changes and fluid in the acromioclavicular joint.

Thinning of the cartilage is noted in the glenohumeral joint.

There is increased signal in the mid portion of the supraspinatus tendon suggesting a partial non-retracted tear.

The infraspinatus, long head of the biceps and subscapularis tendons demonstrate no abnormality.

There is abnormal signal and truncation of the anterior and posterior glenoid labrum suggesting a labral tear.

Fluid is noted in the subcoracoid bursa.

There is fluid adjacent to the supraspinatus, infraspinatus and subscapularis muscles. There is no bony lesions, fracture or bone marrow edema identified.

IMPRESSION:

1. PARTIAL NON-RETRACTED INTRASUBSTANCE TEAR OF THE MID PORTION OF THE SUPRASPINATUS TENDON.
2. FLUID IN THE SUBCORACOID BURSA.
3. TEAR OF THE ANTERIOR AND POSTERIOR GLENOID LABRUM.
