MRN: CamL5189

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There are interstitial tears at the attachments of the supraspinatus and infraspinatus tendons best seen on image 11 of the coronal PD fat-saturated series and image 25 of the sagittal series. There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is acromioclavicular joint separation superimposed on moderate acromioclavicular joint disease.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There are multifocal tears of the glenoid labrum.

GLENOHUMERAL CARTILAGE: There are broad regions of full-thickness chondral loss on both sides of the glenohumeral joint with remodeling of the subchondral bone plates, subchondral cystic changes, and marginal osteophytes.

SYNOVIUM/JOINT FLUID: There is a glenohumeral joint effusion.

MARROW: No acute fractures or osteonecrosis.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Interstitial tears at the attachments of the supraspinatus and infraspinatus tendons superimposed on tendinitis.
