SERVICE:	MRI RIGHT KNEE
DATE OF SERVICE:	10/21/2022

MRI SCAN OF THE RIGHT KNEE

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right knee was performed utilizing multiplanar and multisequence acquisition. The study is limited due to technical factors.

FINDINGS:

There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is joint fluid compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes appear intact.

The popliteal and quadriceps tendons and the patellar ligament are unremarkable. The patellar retinacula are intact.

The medial and lateral menisci appear intact. There is no evidence of a meniscal tear.

IMPRESSION:

Technically limited study. If clinically warranted, a repeat MRI scan should be ordered for further evaluation.

Presence of joint fluid compatible with synovitis.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes appear intact.

The meniscal structures appear intact.

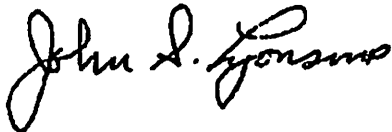

In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.
