IDY LIANG, NP-C
5205 CHURCH AVENUE
BROOKLYN, NY 11203

PATIENT: CATHERINE LITTLES
DOB: 11/07/1941 DOS: 10/03/2022 CHART #: 4288
EXAM: MRI OF THE RIGHT HIP WITHOUT CONTRAST

HISTORY: Hip pain, radiating down the leg.

TECHNIQUE: Multiplanar MR imaging of the right hip was performed without contrast on Hitachi open MRI unit.

Coronal T1 weighted images, axial proton density and T2 weighted images and coronal STIR images, Coronal, axial and sagittal T2 oblique of the hip were obtained without contrast.

COMPARISON: None.

FINDINGS: There is no bone marrow edema, bony lesion or fracture identified.

There is small effusion in the hip joint. There is large amount of fluid identified adjacent to the greater trochanter suggesting greater trochanteric bursitis. There is a partial tear of the distal aspect of the gluteus medius tendon. The acetabular labrum and periarticular muscles are normal in signal and appearance.

An approximately 3.0 cm cyst is noted in the midline along the inferior aspect of the coccyx.

IMPRESSION:

1. FINDING SUGGESTING A PARTIAL TEAR OF THE GLUTEUS MEDIUS TENDON.
2. LARGE COMPLEX FLUID ADJACENT TO THE GREATER TROCHANTER SUGGESTING GREATER TROCHANTER BURSITIS.
3. SMALL JOINT EFFUSION.
4. APPROXIMATELY 3.0 CM CYST IN THE SOFT TISSUE ALONG THE INFERIOR ASPECT OF THE COCCYX.

Thank you for referring this patient to us.
