**LEFT KNEE MRI WITHOUT CONTRAST**

**HISTORY:** Left knee pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the left knee was obtained without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**LIGAMENTS:** Status post bone patellar tendon bone ACL reconstruction. Intact and anatomically aligned ACL graft. The posterior cruciate ligament is intact. The collateral ligaments are preserved.

**MEDIAL COMPARTMENT:** There is focal linear intermediate signal at the free edge of the posterior horn/body junction of medial meniscus best seen on image 22 of the coronal STIR series 5. This likely represents a focal free edge tear. Intact articular cartilage.

**LATERAL COMPARTMENT:** Intact lateral meniscus and articular cartilage.

**PATELLOFEMORAL COMPARTMENT:** There is a deep chondral fissure at the medial patellar facet.

**MARROW:** Normal marrow signal.

**SYNOVIUM/ JOINT FLUID:** There is a joint effusion.

**MUSCLES:** No muscle edema or fatty muscle atrophy.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**EXTENSOR MECHANISM:** There is insertional quadriceps tendinitis with reactive edema within the suprapatellar fat. The patella tendon is preserved.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Status post ACL reconstruction with intact and anatomically aligned ACL graft.

**HIGHLINE**  
RADIOLOGY

**Highline Radiology**

Suspected focal free edge tear at the posterior horn/body junction of medial meniscus.

Deep chondral fissure at the medial patellar facet.

Joint effusion.

Insertional quadriceps tendinitis with reactive edema within the suprapatellar fat.
