Dear Dr. Barakat:

MRI OF THE RIGHT SHOULDER

TECHNICAL FACTORS:

Noncontrast MRI of the right shoulder performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is no fracture, dislocation or bone lesion. The bones and muscular structures demonstrate normal signal intensity. There is no muscular tear or evidence of hematoma formation.

Joint effusion is present. Glenoid labrum appears intact without paralabral cyst formation. Biceps tendon is intact as well.

There is prominent rotator cuff tendinopathy and bursitis with associated 2mm linear articular surface partial thickness posterodistal infraspinatus tendon tear and 2cm full thickness proximal central supraspinatus tendon tear.
