Re: Nicolas, Noemy
DOB: 04/30/1979
DOA: 04/09/2022

INITIAL ORTHOPEDIC CONSULT EXAMINATION

CHIEF COMPLAINT: Left shoulder, left knee, and left elbow pain.

HISTORY OF PRESENT ILLNESS: A 43-year-old right-hand dominant male involved in a motor vehicle accident on 04/09/2022. The patient was a rear passenger and was wearing a seatbelt. The vehicle was struck on the rear side. The airbags did not deploy. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to Methodist Hospital and was treated and released the same day. The patient presents today complaining of left shoulder, left knee, and left elbow pain sustained in the motor vehicle accident. The patient was attending physical therapy for the last 4-5 weeks with good relief.

WORK HISTORY: The patient is currently not working.

PAST MEDICAL HISTORY: Hypertension.

PAST SURGICAL HISTORY: Noncontributory.

DRUG ALLERGIES: NO KNOWN DRUG ALLERGIES.

MEDICATIONS: The patient is taking pain medications p.r.n. and losartan.

SOCIAL HISTORY: The patient is a nonsmoker. The patient does not drink alcohol. The patient does not use recreational drugs.

ADL CAPABILITIES: The patient states that he can walk for 1/2 block. He can stand for 5 minutes before he has to sit. He can sit for 5 minutes before needing to change positions secondary to pain. As a direct result of the injuries sustained in this accident, the patient states that he is unable to do the following activities: driving, lifting heavy objects, carrying heavy objects, reaching overhead, laundry, shopping, running errands, kneeling, squatting, negotiating stairs, jogging and exercising.

PRESENT COMPLAINTS: Left shoulder: Left shoulder pain is 6-9/10, described as constant, sharp, stabbing, dull, achy pain. The patient has popping and clicking. The patient is unable to reach overhead, unable to reach behind the back, and unable to sleep at night due to pain. Worse with range of motion and improves with rest, medication, and physical therapy.

Left knee: Left knee pain is 6-7/10, described as intermittent, sharp, stabbing, dull, achy pain. The patient has difficulty rising from a chair and has difficulty going up and down stairs. The patient also notes popping and buckling. Worse with range of motion and improves with rest, medication, and physical therapy.

Left elbow: Left wrist pain is 6/10, described as intermittent, dull, achy pain. Admits to numbness. The patient has pain with carrying. Worse with range of motion and improves with rest, medication, physical therapy, and ice.

REVIEW OF SYSTEMS: Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

General: No fever, chills, night sweats, weight gain, or weight loss.

HEENT: No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

Endocrine: No cold intolerance, appetite changes or hair changes.

Skin: Clear, no rashes or lesions.

Neuro: No headaches, dizziness, vertigo or tremor.

Respiratory: No wheezing, coughing, shortness of breath or difficulty breathing.

Cardiovascular: No chest pain, murmurs or irregular heart rate. The patient has hypertension.

GI: No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

GU: No blood in urine, painful urination, loss of bladder control or urinary retention.

Hematology: No active bleeding, bruising, anemia or blood clotting disorders.

Psychiatric: No anxiety, change in sleep pattern, depression or suicidal thoughts.

PHYSICAL EXAMINATION: The patient's height is 5 feet 9 inches, weight is 260 pounds, and BMI is 38.4. The left shoulder reveals tenderness to palpation over supraspinatus tendon region and deltoid. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative drop arm test. Negative cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Positive O'Brien test. Positive impingement sign. Negative Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 110/180 degrees, adduction 30/45 degrees, forward flexion 120/180 degrees, extension 45/60 degrees, internal rotation 65/90 degrees, and external rotation 70/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the left upper extremity.

The left knee reveals tenderness along the medial joint line, superior pole of patella, and inferior pole of the patella. There is crepitus appreciated. There is no heat, swelling, erythema or deformity appreciated. Positive McMurray test. Negative Lachman test. Positive patellofemoral grinding test. Negative anterior drawer. Negative posterior drawer. Range of motion reveals flexion 105/130 degrees and extension 3/5 degrees. Knee is stable with varus and valgus stress test. The patient has no motor or sensory deficit of the left lower extremity.

The left elbow reveals there is tenderness to palpation over the lateral epicondyle. Negative Varus test. Negative Valgus test. Negative Tinel sign. Range of motion reveals flexion 130/150 degrees, extension 130/150 degrees, supination 85/90 degrees, pronation 90/90 degrees.

DIAGNOSTIC TESTING: MRI of the left shoulder, done on 05/14/2022, shows subscapularis tendonitis with associated mild fluid in the superior subscapular recess. Mild fluid in subacromial-subdeltoid bursa compatible with bursitis or may be seen with full thickness rotator cuff tear. Mild subluxation of the acromioclavicular joint with significant hypertrophy of the joint capsule. MRI of the left knee, done on 05/14/2022, shows horizontal tear of the body and posterior horn of the medial meniscus. Edema along the myofascial planes of the partially imaged medial head of the gastrocnemius muscle consistent with myofascial strain.

ASSESSMENT:

1. S46.012A Partial rotator cuff tear, left shoulder.
2. M24.812 Internal derangement, left shoulder.
3. M75.02 Adhesive Capsulitis, left shoulder.
4. M75.82 Shoulder tendinitis, left shoulder.
5. S43.432A Labral tear, left shoulder.
6. M75.42 Impingement, left shoulder.
7. M65.812 Tenosynovitis, left shoulder.
8. M75.52 Bursitis, left shoulder.
9. M75.22 Bicipital Tendinitis, left shoulder.
10. M25.512 Pain, left shoulder.
11. S49.92XA Injury, left shoulder.
12. M67.212 Hypertrophic synovitis, left shoulder.
13. M89.312 Acromioclavicular joint hypertrophy, left shoulder.
14. M25.412 Joint effusion, left shoulder.
15. S83.242A Medial meniscus tear, left knee.
16. M23.92 Internal derangement, left knee.
17. S83.512A Anterior cruciate ligament sprain, left knee.
18. S83.412A Medial collateral ligament sprain, left knee.
19. M94.262 Chondromalacia, left knee.
20. S83.32XA Tear articular cartilage, left knee.
21. M22.2X2 Patellofemoral chondral injury, left knee.
22. M25.462 Joint effusion, left knee.
23. M12.569 Traumatic arthropathy, left knee.
24. S80.912A Injury, left knee.
25. M25.562 Pain, left knee.
26. M65.162 Synovitis, left knee.
27. M24.662 Adhesions, left knee.

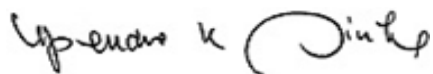

PLAN:

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for left shoulder, left knee, and left elbow.

4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for left shoulder, left knee, and left elbow 3 days/week.
6. The patient is awaiting MRI of the right shoulder and right knee.
7. Discussed left shoulder and left knee arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.
8. The patient needs medical clearance prior to surgery.
9. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other left shoulder and left knee pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
10. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
11. All the benefits and risks of the left shoulder and left knee arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
12. All the questions in regard to the procedure were answered.
13. The patient verbally consents for the arthroscopy of left shoulder and the patient will be scheduled for left shoulder surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon.
14. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

CAUSALITY: It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

AFFIRMATION: Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
