

To: Zilberman, Igor
Exam: MRI LEFT KNEE
Exam Date: 10/07/2022 2:56 PM
Accession: 32508

Patient Name: Lane, Jhavel
DOB: 12/06/1999
Gender: M
MRN: LanJ7009

LEFT KNEE MRI WITHOUT CONTRAST

HISTORY: Left knee pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left knee was obtained without intravenous contrast.

COMPARISON: None available.

FINDINGS:

LIGAMENTS: The cruciate and collateral ligaments are intact.

MEDIAL COMPARTMENT: Intact medial meniscus and articular cartilage.

LATERAL COMPARTMENT: Intact lateral meniscus and articular cartilage.

PATELLOFEMORAL COMPARTMENT: Intact articular cartilage.

MARROW: There is a 4.0 x 3.3 x 2.0 cm lesion with nonaggressive features within the distal femoral metaphysis which demonstrates predominant fat signal with multiple foci of sclerosis/calcification. This is most consistent with an intraosseous lipoma.

SYNOVIUM/ JOINT FLUID: No joint effusion or synovial thickening.

MUSCLES: No muscle edema or fatty muscle atrophy.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

EXTENSOR MECHANISM: The quadriceps tendon is intact. The patella tendon is preserved.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

No evidence of internal arrangement.

Distal femoral intraosseous lesion with nonaggressive features likely representing intraosseous lipoma.
