**RIGHT SHOULDER MRI WITHOUT CONTRAST**

**HISTORY:** Right shoulder pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**ROTATOR CUFF:** There is a partial thickness articular surface tear of the distal infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is subdeltoid/subacromial bursal edema indicative of bursitis.

**MUSCLES:** No intramuscular edema or fatty muscle atrophy.

**AC JOINT:** There is moderate acromioclavicular joint disease with distal clavicular subchondral cystic changes.

**BICEPS TENDON:** Intact long head of the biceps tendon.

**LABRUM/LIGAMENTS:** There is a tear at the base of the superior glenoid labrum anterior to posterior (SLAP tear).

**GLENOHUMERAL CARTILAGE:** Intact articular cartilage.

**SYNOVIUM/JOINT FLUID:** No joint effusion or synovial thickening.

**MARROW:** Normal marrow signal.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Partial-thickness articular surface tear of the distal infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. Associated subdeltoid/subacromial bursitis.
