MRI \ CT \ X-RAY \ MAMMOGRAPHY \ ULTRASOUND \ DEXA

**To:** Clarke, Colin  
2598 THIRD AVE  
BRONX, NY 10454

**Patient Name:** HILLIARD, RALPH  
**DOB:** 03-Apr-1959  
**Gender:** M  
**MRN:** HILR369880  
**Exam Date:** 13-Oct-2022 10:00 AM

**Fax:**  
**Exam#:** 1644494 - MRI RIGHT KNEE

**PROCEDURE**  
**MRI RIGHT KNEE**

**INDICATION**  
**MOTORCYCLE ACCIDENTBOTH KNEES PAINS**

**TECHNIQUE**  
Multiple sequences were obtained in the coronal, sagittal and axial planes

**COMPARISON**  
Comparison made with previous examination(s) dated (MR) 14-Oct-2022,(MR) 13-Oct-2022,(MR) 11-Oct-2022,(MR) 28-Apr-2022,(CR) 16-Mar-2022.

**FINDINGS**  
There is of the prepatellar bursa. Moderate joint effusion is identified. Moderate-sized Baker's cyst is identified.

Mild degenerative changes are noted involving the medial and lateral joint consisting of osteophyte formation. Marrow edema is noted along the ventral aspect of the femoral condyles which is likely degenerative in origin/stress reaction versus the sequela of mild osseous contusion.

The quadriceps and patellar tendons are intact.

There is sprain of the medial collateral ligament.

There is interstitial partial tear of the lateral collateral ligament.

Horizontal cleavage tear is noted involving the anterior and posterior horns of the lateral meniscus.

Horizontal cleavage tear is noted involving the anterior and posterior horns of the medial meniscus.

The anterior cruciate ligament is intact. There is partial tear of the posterior cruciate ligament.

**IMPRESSION**

1. Moderate joint effusion.
2. Moderate-sized Baker's cyst.
3. Mild degenerative changes involving the medial and lateral joint compartments.
4. Mild edema along the ventral aspects of the medial and lateral femoral condyles which may be secondary to stress reaction versus mild osseous contusion.
