PATIENT NAME: CASSANDRA LOGAN
REFERRING PHYSICIAN: JOSEPH MARTONE
SERVICE: MRI LEFT SHOULDER
DATE OF SERVICE: 10/23/2022

MRI SCAN OF THE LEFT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left shoulder was performed utilizing multiplanar and multisequence acquisition. The study is limited due to motion artifact.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. No impingement is demonstrated.

There is minimal fluid in the subdeltoid bursa and moderate fluid in the joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is a hyperintense signal in the anterior superior myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. No surface defects are seen. The findings are compatible with a strain/interstitial tear of this structure.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

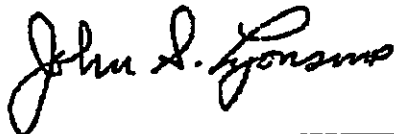

IMPRESSION:

Mild to moderate fluid in the subdeltoid bursa and joint capsule compatible with tenosynovitis/bursitis.

Hyperintense signal in the anterior superior myotendinous supraspinatus compatible with a strain/interstitial tear of this structure.

The visualized portions of the labrum are unremarkable.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
