PATIENT NAME: CARMEN DEL ROSARIO
REFERRING PHYSICIAN: GAETAN J.MARIE
SERVICE: MRI RIGHT KNEE
DATE OF SERVICE: 05/19/2022

MRI SCAN OF THE RIGHT KNEE

CLINICAL HISTORY: Pain.

Routine non-contrast MRI images of the right knee were obtained. Prior imaging correlation is not available.

There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is joint fluid compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear.

There is increased signal in the ACL at its tibial attachment. There is no buckling of the normal PCL. There is no evidence of osseous translation. In the given clinical setting, the findings are compatible with ACL sprain. Clinical confirmation is requested.

The medial and lateral collateral ligament complexes are intact. The popliteal and quadriceps tendons and the patellar ligament are unremarkable. The patellar retinacula are intact.

The medial and lateral meniscal structures are intact. There is no evidence of a meniscal tear.

IMPRESSION:

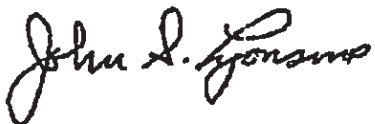

PRESENCE OF JOINT FLUID COMPATIBLE WITH SYNOVITIS.

FINDINGS COMPATIBLE WITH ACL SPRAIN AS DISCUSSED IN THE BODY OF THE REPORT.

THE MENISCAL STRUCTURES ARE INTACT.

NO ACUTE OSSEOUS ABNORMALITIES.

Thank you for the courtesy of this consultation.

John Lyons, M.D.
Radiologist
