Dear Dr. Delorme-Pagan:

### **MRI OF THE RIGHT KNEE**

#### **TECHNICAL FACTORS:**

Noncontrast MRI of the right knee performed utilizing multiplanar and multisequence acquisition.

#### **FINDINGS:**

Early small osteochondral lesion with bone marrow edema is projected beneath the lateral tibial spine. Note is made of advanced apical chondromalacia patellae. Bones and muscular structures otherwise demonstrate normal signal intensity. There is no muscular tear or evidence of hematoma formation.

Joint effusion is present. Retinacular ligaments are intact as is the quadriceps and patellar tendon. Sprain injury is seen at distal anterior cruciate ligament and proximal collateral ligaments. Posterior cruciate ligament is intact. Horizontal tears are seen involving the posterior horns of both medial and lateral menisci. Anterior meniscal horns are intact.

#### **IMPRESSION:**

- Horizontal tears are seen involving the posterior horns of both medial and lateral menisci with joint effusion.
