RIVA GOLDENBERG, M.D.
1314 CONEY ISLAND AVENUE
BROOKLYN, NY 11230

PATIENT: ZHI LI

DOB: 08/15/1978 DOS: 10/14/2020 CHART #: 3213

EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Sharp shoulder pain and weakness after motor vehicle accident.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

FINDINGS: Bone marrow: No bone marrow edema, bony lesion or fracture identified. There is thinning of the cartilage and subchondral changes in the glenohumeral joint. The acromioclavicular joint is preserved. Increased signal is noted in the distal aspect of the supraspinatus tendon along the bursal surface suggesting a partial low-grade non-retracted tear. The infraspinatus, long head of the biceps and subscapularis tendons are normal in signal and appearance.

The glenoid labrum demonstrates no abnormality.

The rotator cuff muscles are preserved. There is fluid in the subacromial/subdeltoid bursa.

IMPRESSION:

1. PARTIAL BURSAL SURFACE TEAR OF THE DISTAL ASPECT OF THE SUPRASPINATUS TENDON.
2. FLUID IN THE SUBACROMIAL/SUBDELTOID BURSA.
3. THINNING OF THE CARTILAGE AND SUBCHONDRAL CHANGES IN THE ACROMIOCLAVICULAR AND THE GLENOHUMERAL JOINT.

Thank you for referring this patient to us.
