Dear Dr. Prince:

MRI OF THE RIGHT ANKLE

TECHNICAL FACTORS:

Noncontrast MRI of the right ankle performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is no fracture, dislocation or bone lesion. The bones and muscular structures demonstrate normal signal intensity. There is no muscular tear or evidence of hematoma formation.

Subtalar effusion is identified with sprain of talocalcaneal ligaments. Achilles tendon is intact. Large inferior heel spur is seen with associated moderate proximal plantar fasciitis. Sprain injury is seen at distal posterior tibial and peroneus brevis tendons. Anterior tibial, extensor digitorum and flexor hallucis longus tendons are intact as are interosseous, deltoid and talofibular ligaments.

IMPRESSION:

- Subtalar effusion is identified with sprain of talocalcaneal ligaments.
- Sprain injury is seen at distal posterior tibial and peroneus brevis tendons.
