PATIENT NAME:	RUBEN BELLO
REFERRING PHYSICIAN:	JORDAN FERSEL
SERVICE:	MRI RIGHT SHOULDER
DATE OF SERVICE:	10/19/2022

MRI SCAN OF THE RIGHT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right shoulder was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is AC joint arthrosis with impingement upon the underlying supraspinatus muscle.

There is atrophy of the rotator cuff with elevation of the humeral head and a decrease in the acromiohumeral interval. There is mild fluid in the subacromial bursa compatible with mild bursitis as well as severe fluid in the joint capsule compatible with severe synovitis. There is no obvious communication between these two fluid compartments across the conjoined tendon. There is no evidence of tendon laxity or retraction. Mild fluid is present in the subcoracoid bursa compatible with mild subcoracoid bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

IMPRESSION:

Arthrosis of the AC joint with impingement.

Atrophy of the rotator cuff with elevation of the humeral head and a decrease in the acromiohumeral interval with mild fluid in the subacromial bursa compatible with mild bursitis, severe fluid in the joint capsule compatible with severe synovitis, and mild fluid in the subcoracoid bursa compatible with mild subcoracoid bursitis. The majority of the rotator cuff findings are presumably secondary to the AC joint arthrosis. Clinical correlation with history and symptomatology/signs is requested.

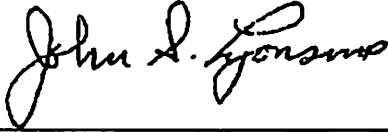

The visualized portions of the labrum are intact.
