

To: Davis, Gordon
Exam: MRI RIGHT SHOULDER
Exam Date: 07/21/2022 4:00 PM
Accession: 28272

Patient Name: Perez, Dolores
DOB: 10/29/1976
Gender: F
MRN: PerD6111

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is supraspinatus and infraspinatus tendinitis. There is subdeltoid/subacromial bursal edema indicative of bursitis. The subscapularis and teres minor tendons are intact. There is no rotator cuff tear. There is anterolateral downsloping of the acromion which contributes to rotator cuff impingement.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) which propagates posteriorly to the level of the posterior glenoid labrum. There is a developing intra-labral cyst within the posterior superior labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) which propagates posteriorly to the level of the posterior glenoid labrum. Associated developing intra-labral cyst within the posterior superior labrum.
