PATIENT NAME	WILKINS, ROBERT
D.O.B.	10/27/1972
PATIENT #	1895
DATE OF SERVICE	10/13/2022
REF. PHYSICIAN	SAYEED, QUAIS KAMAL D.C

MRI OF THE RIGHT ANKLE WITHOUT CONTRAST

INDICATION: Right ankle pain

TECHNIQUE: T1, T2, and STIR weighted sequences were obtained.

COMPARISON: No prior studies were available for comparison at the time of dictation.

FINDINGS:

No fracture. The ankle mortise is intact, without widening. The distal tibiofibular syndesmosis is intact. No osteochondral lesion. Normal articular cartilage. No coalition. Edema and cystic change within the lateral aspect of the talar head and neck.

Achilles tendon is intact. Tendinosis of the distal posterior tibial tendon with suspected focal interstitial type tear and tenosynovitis near the distal insertion and at the level of the spring ligament. The flexor digitorum longus tendon is normal. Flexor hallucis longus tendon is normal. Extensor tendons are intact. Normal peroneus brevis and longus tendons.

The anterior talofibular ligament is intact. The posterior talofibular ligament is intact. Loss of normal striated morphology involving the deep deltoid ligament fibers. Suspected full-thickness tear superomedial band spring ligament with poorly visualized tibiospring ligament. The syndesmotic ligaments are intact. Calcaneofibular ligament is intact.

No significant effusion. Small inferior calcaneal spur with thickening of the central cord plantar fascia but without fluid signal intensity tear. Normal sinus Tarsi. No muscle edema.

IMPRESSION:

1. Sequela plantar fasciitis.
2. High-grade full-thickness tear superomedial band spring ligament with poorly visualized tibiospring ligament. Additionally, tendinosis and focal interstitial type tear of the distal posterior tibial tendon.
