LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is no rotator cuff tear.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is mild acromioclavicular joint disease. There is an anteriorly downsloping acromion which contributes to rotator cuff impingement.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear of the posterior superior to posterior inferior glenoid labrum. There is an additional tear of the anterior inferior glenoid labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: There is small glenohumeral joint fluid.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Multifocal labral tears.

Supraspinatus and infraspinatus tendinitis. Evidence of rotator cuff impingement secondary to anteriorly downsloping acromion. Mild acromioclavicular joint disease.
