PATIENT NAME: SHANISE WILLIAMS
REFERRING PHYSICIAN: PHYLLIS GELB
SERVICE: MRI LEFT HIP
DATE OF SERVICE: 07/14/2022

MRI SCAN OF THE LEFT HIP

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left hip was performed utilizing multiplanar and multisequence acquisition. Comparison images of the left hip were also performed.

FINDINGS:

Where direct comparisons can be made, there are no appreciable asymmetries between the left hip and the right hip. The hip joints are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

The visualized acetabular labrum appears intact. There is no evidence of tear. The muscle, fat, and fascial planes are well maintained.

The visualized pelvic osseous structures are intact without evidence of fracture, dislocation, or bone marrow abnormalities.

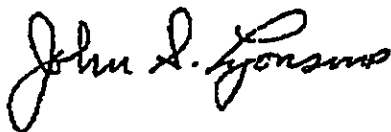

There is incomplete characterization of a bulky fibroid uterus. If clinically warranted, pelvic sonography should be ordered for further evaluation.

IMPRESSION:

No acute pathology. In the given clinical setting of trauma, the study is inconclusive which implies the need for further clinical investigation.

Incompletely characterized, bulky fibroid uterus. If clinically warranted, pelvic sonography should be ordered for further evaluation.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
