**RIGHT SHOULDER MRI WITHOUT CONTRAST**

**HISTORY:** Right shoulder pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**ROTATOR CUFF:** There is an interstitial tear at the confluence of the supraspinatus and infraspinatus tendons. There is a partial-thickness articular surface tear of the distal subscapularis tendon. There is supraspinatus, infraspinatus, and subscapularis tendinitis. The teres minor tendon is intact. There is subdeltoid/subacromial bursal edema indicative of bursitis.

**MUSCLES:** No muscle edema or fatty muscle atrophy.

**AC JOINT:** Intact. There is subacromial spurring likely contributing to rotator cuff impingement.

**BICEPS TENDON:** There is tenosynovitis of the extra articular long head of the biceps tendon.

**LABRUM/LIGAMENTS:** There is a tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) with a partial tear of the biceps labral anchor complex.

**GLENOHUMERAL CARTILAGE:** Intact articular cartilage.

**SYNOVIUM/JOINT FLUID:** There is a glenohumeral joint effusion.

**MARROW:** Normal marrow signal.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) with a partial tear of the biceps labral anchor complex and a glenohumeral joint effusion.

---

Partial-thickness articular surface tear of the distal subscapularis tendon. Interstitial tear at the confluence of the distal supraspinatus and infraspinatus tendons. Background of supraspinatus, infraspinatus, and subscapularis tendinitis with subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to subacromial spurring.

Tenosynovitis of the extra articular long head of the biceps tendon.
