Re: Johnson, Ramoy
DOB: 11/29/2002
DOA: 07/09/2022

INITIAL ORTHOPEDIC CONSULT EXAMINATION

CHIEF COMPLAINT: Left shoulder, left knee pain, and low-back pain.

HISTORY OF PRESENT ILLNESS: A 19-year-old right-hand dominant male involved in a motor vehicle accident on 07/09/2022. The patient was a driver and was wearing a seatbelt. The vehicle was struck on the rear driver side. The airbags did not deploy. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to Jamaica Hospital Medical Center and was treated and released the same day. The patient presents today complaining of left shoulder, left knee, and low-back pain sustained in the motor vehicle accident. The patient was attending physical therapy for 3-4 times a week with little relief.

WORK HISTORY: The patient is currently working fulltime as a cargo agent.

PAST MEDICAL HISTORY: Noncontributory. There is no previous history of trauma.

PAST SURGICAL HISTORY: Noncontributory.

DRUG ALLERGIES: NO KNOWN DRUG ALLERGIES.

MEDICATIONS: The patient is taking muscle relaxant and Motrin.

SOCIAL HISTORY: The patient is a nonsmoker. The patient does not drink alcohol. The patient does not use recreational drugs.

ADL CAPABILITIES: The patient states that he can walk for 2 blocks. He can stand for 2 minutes before he has to sit. He can sit for 5 minutes before needing to change positions

secondary to pain. As a direct result of the injuries sustained in this accident, the patient states that he is unable to do the following activities: Garden, play sports, lifting heavy objects, carrying heavy objects, laundry, shopping, kneeling, squatting, and exercising.

PRESENT COMPLAINTS: Left shoulder: Left shoulder pain is 6/10, described as intermittent, sharp, stabbing, dull, achy pain. The patient has weakness, popping, and clicking. The patient is unable to reach overhead, unable to reach behind the back, and unable to sleep at night due to pain.

Left knee: Left knee pain is 4/10, described as intermittent, sharp, stabbing, dull, achy pain. The patient has weakness. The patient has difficulty rising from a chair and has difficulty going up and down stairs. The patient also notes clicking, popping, and buckling.

REVIEW OF SYSTEMS: Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

General: No fever, chills, night sweats, weight gain, or weight loss.

HEENT: No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

Endocrine: No cold intolerance, appetite changes or hair changes.

Skin: Clear, no rashes or lesions.

Neuro: No headaches, dizziness, vertigo or tremor.

Respiratory: No wheezing, coughing, shortness of breath or difficulty breathing.

Cardiovascular: No chest pain, murmurs, irregular heart rate or hypertension.

GI: No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

GU: No blood in urine, painful urination, loss of bladder control or urinary retention.

Hematology: No active bleeding, bruising, anemia or blood clotting disorders.

Psychiatric: No anxiety, change in sleep pattern, depression or suicidal thoughts.

PHYSICAL EXAMINATION: The patient's height is 5 feet 10 inches, weight is 135 pounds, and BMI is 19.4. The left shoulder reveals tenderness to palpation over supraspinatus tendon region. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative drop arm test. Negative cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Positive O'Brien test. Positive impingement sign. Negative Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 140/180 degrees, adduction 40/45 degrees, forward flexion 115/180 degrees, extension 50/60 degrees, internal rotation 75/90 degrees, and external rotation 80/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the left upper extremity.

The left knee reveals tenderness along the medial joint line and superior pole of patella. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative McMurray test. Negative Lachman test. Negative patellofemoral grinding test. Negative anterior drawer. Negative posterior drawer. Range of motion reveals flexion 115/130 degrees and extension 0/5 degrees. Knee is stable with varus and valgus stress test. The patient has no motor or sensory deficit of the left lower extremity.

DIAGNOSTIC TESTING: MRI of the left shoulder, done on 08/16/2022, tendinosis/tendonitis with intrasubstance cuff tearing of the supraspinatus and infraspinatus portions of the cuff. Synovitis of the patulous axillary pouch of the inferior glenohumeral ligament. Impingement. Glenohumeral joint effusion. The anterior and posterior labrum are partially torn and avulsed. The biceps tendon is hypoplastic.

ASSESSMENT:

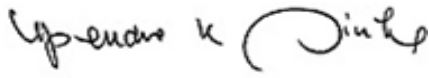

1. S46.012A Partial rotator cuff tear, left shoulder.
2. M24.812 Internal derangement, left shoulder.
3. M75.02 Adhesive Capsulitis, left shoulder.
4. S43.432A Labral tear, left shoulder.
5. M75.42 Impingement, left shoulder.
6. M65.812 Tenosynovitis, left shoulder.
7. M25.512 Pain, left shoulder.
8. S49.92XA Injury, left shoulder.
9. M25.412 Joint effusion, left shoulder.
10. M23.92 Internal derangement, left knee.
11. M12.569 Traumatic arthropathy, left knee.
12. S80.912A Injury, left knee.
13. M25.562 Pain, left knee.

PLAN:

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for left shoulder and left knee.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for left shoulder and left knee 3 days/week.
6. The patient is awaiting MRI of the left knee (done on 08/29/2022).
7. Discussed left shoulder arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient wants to think about surgery.
8. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other left shoulder pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
9. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
10. All the benefits and risks of the left shoulder arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
11. All the questions in regard to the procedure were answered.
12. Follow up in 2 weeks.

CAUSALITY: It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

AFFIRMATION: Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
