DOA: 09/10/2022

INITIAL ORTHOPEDIC CONSULT EXAMINATION

CHIEF COMPLAINT: Right shoulder, neck, and low back pain.

HISTORY OF PRESENT ILLNESS: A 37-year-old right-hand dominant female involved in a motor vehicle accident on 09/10/2022. The patient was a front passenger and was wearing a seatbelt. The vehicle was struck on the passenger side front. The airbags deployed. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to NYC Health + Hospitals/Harlem and was treated and released the same day. The patient presents today complaining of right shoulder, neck, and low back pain sustained in the motor vehicle accident. The patient was attending physical therapy 3 times a week with little relief.

WORK HISTORY: The patient is currently not working. The patient last worked in May 2022.

PAST MEDICAL HISTORY: Hypertension. There is no previous history of trauma.

PAST SURGICAL HISTORY: Noncontributory.

DRUG ALLERGIES: NO KNOWN DRUG ALLERGIES.

MEDICATIONS: The patient is taking Motrin and losartan.

SOCIAL HISTORY: The patient is a nonsmoker. The patient does not drink alcohol. The patient does not use recreational drugs.

ADL CAPABILITIES: As a direct result of the injuries sustained in this accident, the patient states that she is unable to do the following activities: driving, lifting heavy objects, carrying, reaching overhead, laundry, shopping, running errands, and exercising.

PRESENT COMPLAINTS: Right shoulder: Right shoulder pain is 8/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness, weakness, popping, and clicking. The patient is unable to reach overhead, unable to reach behind the back, and unable to sleep at night due to pain.

REVIEW OF SYSTEMS: Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

General: No fever, chills, night sweats, weight gain, or weight loss.

HEENT: No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

Endocrine: No cold intolerance, appetite changes or hair changes.

Skin: Clear, no rashes or lesions.

Neuro: No headaches, dizziness, vertigo or tremor.

Respiratory: No wheezing, coughing, shortness of breath or difficulty breathing.

Cardiovascular: No chest pain, murmurs, or irregular heart rate. The patient has hypertension.

GI: No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

GU: No blood in urine, painful urination, loss of bladder control or urinary retention.

Hematology: No active bleeding, bruising, anemia or blood clotting disorders.

Psychiatric: No anxiety, change in sleep pattern, depression or suicidal thoughts.

PHYSICAL EXAMINATION: The patient's height is 5 feet 3 inches, weight is 130 pounds, and BMI is 23. The right shoulder reveals tenderness to palpation over supraspinatus tendon region. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative drop arm test. Negative cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Positive O'Brien test. Positive impingement sign. Negative Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 120/180 degrees, adduction 40/45 degrees, forward flexion 110/180 degrees, extension 50/60 degrees, internal rotation 75/90 degrees, and external rotation 80/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

DIAGNOSTIC TESTING: MRI of the right shoulder, done on 10/26/2022, shows supraspinatus tendon enlarged and inhomogeneous extending toward its anterior leading edge and distally representing tendinosis/tendinopathy where there is fraying of the bursal margin of the distal supraspinatus tendon obscuring the adjacent peritendinous fat. Distal subscapularis tendon inhomogeneous with tendinosis/tendinopathy. Slightly low-lying position to the anterior acromion. Superior labral SLAP lesion at the 12 o'clock location at the labrocartilaginous junction, without extension to the biceps anchor. Paucity of fluid at the subscapularis recess of the glenohumeral joint.

ASSESSMENT:

1. M24.811 Internal derangement, right shoulder.
2. M75.01 Adhesive capsulitis, right shoulder.

3. M75.81 Shoulder tendinitis, right shoulder.
4. S43.431A Labral tear, right shoulder.
5. S43.431A Superior labrum, anterior and posterior tear, right shoulder.
6. M75.41 Impingement, right shoulder.
7. M75.51 Bursitis, right shoulder.
8. M25.511 Pain, right shoulder.
9. S49.91XA Injury, right shoulder.
10. M25.411 Joint effusion, right shoulder.

PLAN:

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for right shoulder.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for right shoulder 3 days/week.
6. Discussed right shoulder arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.
7. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other right shoulder pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
8. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
9. All the benefits and risks of the right shoulder arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
10. All the questions in regard to the procedure were answered.
11. The patient verbally consents for the arthroscopy of right shoulder and the patient will be scheduled for right shoulder surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon. The patient has a history of hypertension.
12. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

CAUSALITY: It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

AFFIRMATION: Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby

affirm under penalty of perjury that the statements contained herein are true and accurate.
