MRI SCAN OF THE RIGHT ANKLE

CLINICAL HISTORY: Pain.

Routine non-contrast MRI images of the right ankle were obtained. Prior imaging correlation is not available.

There is ankle joint fluid compatible with synovitis. Soft tissue edema is present. The ankle mortise and subtalar joint are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusion, stress fractures, or acute trabecular microfractures.

There is fluid in the peroneal tendon sheath and in the three flexor tendon sheaths. The findings are compatible with tenosynovitis of these structures.

There is an approximate 1cm area of swelling and increased interstitial signal in the Achilles tendon, approximately 1.5cm above its insertion. Fluid is present in the retrocalcaneal bursa. There is mild edema in the pre-Achilles fat pad. The findings are compatible with Achilles tendon strain/interstitial tear with associated peritendonitis.

There is increased signal in the anterior talofibular ligament with mild relative swelling adjacent to its tibial insertion. There is no evidence of retraction. The findings are compatible with an ATFL sprain/interstitial tear.

The spring, deltoid, and remaining visualized ligamentous and tendinous structures and the plantar fascia are otherwise intact. The muscle, fat, and fascial planes are otherwise well maintained.

IMPRESSION:

PRESENCE OF ANKLE JOINT FLUID COMPATIBLE WITH SYNOVITIS AND SOFT TISSUE EDEMA.

FLUID IN THE PERONEAL TENDON SHEATH AND THE THREE FLEXOR TENDON SHEATHS COMPATIBLE WITH TENOSYNOVITIS OF THESE STRUCTURES.

FINDINGS COMPATIBLE WITH ACHILLES TENDON STRAIN/INTERSTITIAL TEAR WITH ASSOCIATED PERITENDONITIS.

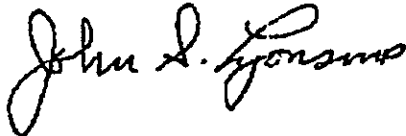

ATFL SPRAIN/INTERSTITIAL TEAR AS DESCRIBED ABOVE.
