BROOKLYN, NY 11203

PATIENT: JANICE THOMAS
DOB: 02/16/1959 DOS: 10/20/2022 CHART #: 4364
EXAM: MRI OF THE RIGHT KNEE WITHOUT CONTRAST

HISTORY: Knee pain, weakness, limited range of motion.

TECHNIQUE: Multiplanar MR imaging of the right knee was performed without contrast on Hitachi open MRI unit.

Coronal PD, T2 and STIR; sagittal PD and PD fat suppressed; axial T2 and T2 fat suppressed images of the knee were obtained.

COMPARISON: None.

FINDINGS: There is no bone marrow edema, bony lesion or fracture identified.

Linear increased signal is noted in the posterior horn of the medial meniscus with extension to the tibial articular surface suggesting meniscal tear. The anterior horn of the medial meniscus, lateral meniscus, anterior and posterior cruciate ligaments are normal in signal and appearance.

The collateral ligaments, quadriceps and patella tendons are preserved.

There is soft tissue edema along the anterior aspect of the knee joint.

IMPRESSION:

1. OBLIQUE TEAR OF THE POSTERIOR HORN OF THE MEDIAL MENISCUS WITH EXTENSION TO THE TIBIAL ARTICULAR SURFACE.
2. SOFT TISSUE EDEMA ALONG THE ANTERIOR ASPECT OF THE KNEE JOINT.

Thank you for referring this patient to us.
