Dear Dr. Coburn:

MRI OF THE RIGHT ELBOW

Multiplanar, multisequence, multiecho MRI examination was performed through the right elbow without intravenous contrast using a low field MRI.

The bony structures are well aligned. There is no fracture, suspicious intrinsic lesion, or evidence of osteonecrosis.

The articular cartilages appear well preserved.

There is no significant joint effusion.

There is a partial tear of the common extensor tendon at the lateral epicondyle. The biceps, triceps, brachialis, and common flexor tendons appear intact.

No ligamentous disruptions are appreciated.

No masses or collections are appreciated.

The ulnar nerve is unremarkable.

IMPRESSION:

1. Partial tear of the common extensor tendon at the lateral epicondyle.

Thank you for this referral.

John Himelfarb, MD
