DOA: 09/19/2022

## **INITIAL ORTHOPEDIC CONSULT EXAMINATION**

**CHIEF COMPLAINT:** Right shoulder and left shoulder pain.

**HISTORY OF PRESENT ILLNESS:** A 21-year-old right-hand dominant female involved in a motor vehicle accident on 09/19/2022. The patient was a rear passenger and was wearing a seatbelt. The vehicle was struck on the rear side. The airbags did not deploy. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to Lincoln Medical Center and was treated and released the same day. The patient presents today complaining of right shoulder and left shoulder pain sustained in the motor vehicle accident. The patient was attending physical therapy for the last 6 weeks with no relief.

**WORK HISTORY:** The patient is currently not working.

**PAST MEDICAL HISTORY:** Positive for asthma, last attack in August of 2022. There is no previous history of trauma.

**PAST SURGICAL HISTORY:** Positive for right ovarian cyst removal done 5 years ago.

**DRUG ALLERGIES:** NO KNOWN DRUG ALLERGIES.

**MEDICATIONS:** The patient is taking pain medications p.r.n.

**SOCIAL HISTORY:** The patient is a nonsmoker. The patient does not use any recreational drugs. The patient does not drink alcohol.

**ADL CAPABILITIES:** As a direct result of the injuries sustained in this accident, the patient states that she is unable to do the following activities: driving, lifting heavy objects, carrying, reaching overhead, laundry, shopping, running errands, and exercising.

**PRESENT COMPLAINTS:** Right shoulder: Right shoulder pain is 10/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness. The patient is able to reach overhead, but unable to reach behind the back and unable to sleep at night due to pain. Worse with range of motion and improves with rest, medication and physical therapy.

Left shoulder: Left shoulder pain is 10/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness, popping, and clicking. The patient is able to reach overhead or behind the back, but unable to sleep at night due to pain. Worse with range of motion and improves with rest.

**REVIEW OF SYSTEMS:** Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

**General:** No fever, chills, night sweats, weight gain, or weight loss.

**HEENT:** No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

**Endocrine:** No cold intolerance, appetite changes or hair changes.

**Skin:** Clear, no rashes or lesions.

**Neuro:** No headaches, dizziness, vertigo or tremor.

**Respiratory:** No wheezing, coughing, shortness of breath or difficulty breathing.

**Cardiovascular:** No chest pain, murmurs, irregular heart rate or hypertension.

**GI:** No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

**GU:** No blood in urine, painful urination, loss of bladder control or urinary retention.

**Hematology:** No active bleeding, bruising, anemia or blood clotting disorders.

**Psychiatric:** No anxiety, change in sleep pattern, depression or suicidal thoughts.

**PHYSICAL EXAMINATION:** The patient's height is 5 feet 7 inches, weight is 190 pounds, and BMI is 29.8. The right shoulder reveals tenderness to palpation over supraspinatus tendon region, AC joint, and proximal biceps tendon. There is no heat, swelling, erythema, or deformity appreciated. There is crepitus appreciated. Negative drop arm test. Positive cross-over test. Positive empty can test. Positive Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Positive Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 110/180 degrees, adduction 40/45 degrees, forward flexion 125/180 degrees, extension 45/60 degrees, internal rotation 50/90 degrees, and external rotation 65/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

The left shoulder reveals tenderness to palpation over supraspinatus tendon region, AC joint, and proximal biceps tendon. There is no heat, swelling, erythema or deformity appreciated. There is crepitus appreciated. Negative drop arm test. Positive cross-over test. Positive empty can test. Positive Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Positive Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 105/180 degrees, adduction 40/45 degrees, forward flexion 115/180

degrees, extension 40/60 degrees, internal rotation 40/90 degrees, and external rotation 50/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

**DIAGNOSTIC TESTING:** MRI of the right shoulder, done on 11/01/2022, shows malalignment of the AC joint with impingement. Minimal fluid in the subdeltoid bursa and joint capsule compatible with tenosynovitis/bursitis. Findings compatible with strain/interstitial tear of the myotendinous supraspinatus as well as strain/partial tear of the subscapularis tendon. The visualized portions of the labrum appear intact. MRI of the left shoulder, done on 11/09/2022, shows malalignment of the AC joint with impingement. Myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis. The visualized portions of the labrum appear unremarkable.

**ASSESSMENT:**

1. S46.011A Partial rotator cuff tear, right shoulder.
2. M24.811 Internal derangement, right shoulder.
3. M75.81 Shoulder tendinitis, right shoulder.
4. M75.41 Impingement, right shoulder.
5. M65.811 Tenosynovitis, right shoulder.
6. M75.51 Bursitis, right shoulder.
7. M25.511 Pain, right shoulder.
8. S49.91XA Injury, right shoulder.
9. M89.311 Acromioclavicular joint hypertrophy, right shoulder.
10. M25.411 Joint effusion, right shoulder.
11. S46.012A Partial rotator cuff tear, left shoulder.
12. M24.812 Internal derangement, left shoulder.
13. M75.82 Shoulder tendinitis, left shoulder.
14. M75.42 Impingement, left shoulder.
15. M65.812 Tenosynovitis, left shoulder.
16. M75.52 Bursitis, left shoulder.
17. M25.512 Pain, left shoulder.
18. S49.92XA Injury, left shoulder.
19. M89.312 Acromioclavicular joint hypertrophy, left shoulder.
20. M25.412 Joint effusion, left shoulder.

**PLAN:**

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for right shoulder and left shoulder.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for right shoulder and left shoulder 3 days/week.
6. Recommend steroid injections with pain management for right shoulder and left shoulder. The patient refuses due to side effects.
7. Discussed right shoulder and left shoulder arthroscopies versus conservative management with the patient. The patient states that due to continual pain and lack of relief with

physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.

8. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other right shoulder and left shoulder pathologies in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
9. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
10. All the benefits and risks of the right shoulder and left shoulder arthroscopies have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
11. All the questions in regard to the procedure were answered.
12. The patient verbally consents for the arthroscopy of right shoulder and left shoulder, and the patient will be scheduled for left shoulder surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon.
13. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

**CAUSALITY:** It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

**AFFIRMATION:** Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
