PATIENT NAME: Yohanny C Fernandez
DOB: 4/3/1978
DATE OF SERVICE: 11/1/2021
REFERRING DOCTOR: Adnan A. Qureshi, M.D.

MRI Left Shoulder:

TECHNIQUE: Magnetic Resonance Imaging is Performed In Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

The supraspinatus tendon is effaced by abnormal hyperintensity extending to its greater tuberosity insertion. Superior bursal and inferior articular surfaces are undetermined. Findings are compatible with tendinitis and partial tear. Frank muscular retraction has not developed.

The visualized glenoid labrum outlines anatomically. Biceps tendon is free from interruption. Some fluid extends along the subacromial bursa. Osseous structures maintain unremarkable alignment. Marrow heterogeneity could be related to red marrow reconversion. Suspicion is not raised for fracture, subluxation or replacement process. Smooth humeral head. Hypertrophic acromioclavicular joint. Consideration is given to some coracoacromial arch constriction. No periarthritic mass is declared. Axilla appears clear of lymphadenopathy.

IMPRESSION:

1. Evidence supporting rotator cuff tendinitis and partial tear.
2. Associated bursitis.
3. Some impingement suggested.

Thank you for the courtesy of this consultation.
