LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is a high-grade interstitial tear at the confluence of the supraspinatus and infraspinatus tendon attachments superimposed on tendinitis. There is additional subscapularis tendinitis. The teres minor tendon is intact. There is subdeltoid/subacromial bursal fluid and edema in keeping with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is moderate acromioclavicular joint disease with capsular thickening and marginal osteophytes which exert mass-effect on the supraspinatus myotendinous junction. There is an anteriorly curved acromion which also contributes to the rotator cuff management.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: No labral tear.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

High-grade interstitial tear at the confluence of the supraspinatus and infraspinatus tendons superimposed on supraspinatus, infraspinatus, and subscapularis tendinitis. Associated

subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to moderate acromioclavicular joint disease and anteriorly curved acromion.

Tenosynovitis of the extra articular long head of the biceps tendon.
