PATIENT NAME: Aguada Bock-Perez

DOB: 4/16/1970

DATE OF SERVICE: 9/10/2021

REFERRING DOCTOR: Adnan A. Qureshi, M.D.

MRI Right Wrist:

TECHNIQUE: Magnetic Resonance Imaging Is Performed In Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

Osseous structures maintain unremarkable alignment. There is no evidence for fracture or subluxation.

Carpus remains adequately preserved. Cystic changes are present, particularly involving triquetrum.

Significant osteoarthropathy has not developed.

Frank erosive or replacement process is not declared. Osteonecrosis also fails to be imaged.

Extensor carpi ulnaris emanates increased interstitial intensity. Consideration is given to tendinitis. Possible partial tear component cannot be excluded. Flexor tendon compartment harbors no rupture. There are no signs of tenosynovitis.

Partially visualized ligaments, including scapholunate and lunotriquetral ligaments appear free from interruption.

Suspicion is not raised for dominant soft tissue mass or loculated fluid collection. Pathologic calcified signal voids appear absent.

Clinical correlation is advised.

IMPRESSION:

1. Extensor carpi ulnaris tendon injury suggested.
2. No significant bony derangement identified.

Thank you for the courtesy of this consultation.
