

To: Zilberman, Igor
Exam: MRI RIGHT SHOULDER
Exam Date: 09/20/2022 10:17 AM
Accession: 32535

Patient Name: Cadet, David
DOB: 07/05/1985
Gender: M
MRN: CadD7018

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is supraspinatus and infraspinatus tendinitis. There is thickening and edema of the subdeltoid/subacromial bursa consistent with bursitis. The subscapularis and teres minor tendons are intact. There is no rotator cuff tear.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact. There is an anteriorly curved acromion and subacromial spurring which contribute to rotator cuff impingement.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There are tears of the posterior superior and posterior inferior glenoid labrum. There are several paralabral cysts, largest measuring 7 x 9 mm adjacent to the posterior inferior glenoid.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Tears of the posterior superior and posterior inferior glenoid labrum with associated paralabral cysts.
