IDY LIANG, NP-C
5205 CHURCH AVENUE
BROOKLYN, NY 11203

PATIENT: CATHERINE LITTLES
DOB: 11/07/1941 DOS: 09/22/2022 CHART #: 4288
EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Shoulder pain, weakness, difficulty lifting the arm up.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

FINDINGS: No bone marrow edema, bony lesion or fracture identified.

There are subchondral changes and fluid in the acromioclavicular joint. Small effusion is noted in the glenohumeral joint.

There is linear increased signal in the distal aspect of the infraspinatus tendon along the articular surface suggesting a partial non-retracted tear. The supraspinatus, long head of the biceps and subscapularis tendons are normal in signal and appearance. There is deformity of the glenoid labrum. Fluid is noted in the subacromial/subdeltoid bursa. The rotator cuff muscles are normal in signal and appearance. Periarticular soft tissue planes are maintained.

IMPRESSION:

1. PARTIAL NON-RETRACTED ARTICULAR SURFACE TEAR OF THE DISTAL ASPECT OF THE INFRASPINATUS TENDON.
2. DEFORMITY OF THE GLENOID LABRUM.
3. FLUID IN THE SUBACROMIAL/SUBDELTOID BURSA AND SMALL EFFUSION IN THE GLENOHUMERAL JOINT.

Thank you for referring this patient to us.
