PATIENT NAME SARMIENTO, CLAUDIA
D.O.B. 03/31/1982
PATIENT # 0000013611
DATE OF SERVICE 05/12/2022
REF. PHYSICIAN RAHMAN, QUAZI MD

MRI OF THE RIGHT KNEE WITHOUT CONTRAST

INDICATION: Right knee pain

COMPARISON: No prior studies were available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD axial, coronal, and sagittal sequences without intravenous contrast.

FINDINGS:

Osseous structures: No evidence of fracture or suspicious lesions. Marrow signal preserved.

Menisci: Medial and lateral menisci are intact with overall normal signal and morphology. No meniscocapsular separation. No meniscal cyst.

Anterior cruciate ligament: Broad intrasubstance increased signal in the mid and distal segments suggesting either intrasubstance degeneration or interstitial tear. If there are persistent symptoms arthroscopy recommended for better evaluation.

Posterior cruciate ligament: Intact

Mediocolateral ligament: Normal

The lateral collateral ligament/posterolateral corner complex: Iliotibial band, lateral (fibular) collateral ligament, biceps femoris, and conjoined tendons intact. Popliteus tendon and muscle are normal. Remaining visualized posterolateral corner structures are without significant abnormality.

Quadriceps and patellar tendons: Intact. No patellar tilt or subluxation. Patellofemoral ligaments are intact.

Cartilage: Areas of intermediate to high-grade chondrosis lateral patellar facet with suspected areas of basal chondral delamination. Well maintained. Cartilage over femorotibial joints are maintained without prominent fibrillation or flap. No evidence of osteochondral injury.

Joint spaces: Anatomically aligned. No loose bodies. No significant effusion.

Extra articular soft tissues: Visualized muscle signal is normal. No suspicious fluid collection.

IMPRESSION:

1. ACL findings which may represent intrasubstance degeneration or interstitial tear. If there are persistent symptoms arthroscopy recommended for more definitive evaluation.
2. Areas of intimate to high-grade chondrosis medial patellar facet with suspected basal chondral delamination.

Thank you for this kind referral of this patient.
