PATIENT NAME: BROWN, KERRISHA
DATE OF BIRTH: 03/03/1992
MRN #: BR47721
DATE OF SERVICE: 07/17/2022
REFERRING PHYSICIAN: JORDAN FERSEL, MD

MRI EXAMINATION OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: Right shoulder pain. Status post MVA.

TECHNICAL FACTORS: MRI of the right shoulder utilizing multiple imaging sequences.

COMPARISON: None.

FINDINGS:

There is mild hypertrophy of the acromioclavicular capsule with associated arthropathic changes. These produce impression upon the bursal surface of the supraspinatus muscle/tendon with a small area of subcortical signal abnormality within the articulating portion of the clavicle with the acromion secondary to the arthropathic changes noted. No significant fluid is seen in the subacromial-subdeltoid bursa or the shoulder joint.

There is tendonosis of the rotator cuff tendons with a tear not seen. No labral tears are identified.

The bicipital and intra-articular portions of the biceps tendon are grossly normal.

There is a small area of fluid which appears to relate to the anterior inferior portion of the shoulder joint in relative close proximity to the anterior inferior aspect of the glenoid/glenoid labrum. This is non-specific, although could represent a small paralabral cyst. An adjacent labral tear is not seen, however.

IMPRESSION:

- 1. Mild hypertrophy of the acromioclavicular capsule with associated arthropathic changes contacting the bursal surface of the supraspinatus muscle/tendon.**
- 2. Mild tendonosis of the rotator cuff tendons.**
- 3. Small amount of fluid located antero-inferiorly relative to the glenoid. The possibility this relates to a paralabral cyst is raised, which would suggest the possibility of an inferior labral tear, not seen on this study. A non-specific small area of fluid could also have this appearance. This should be correlated clinically.**

Thank you for the opportunity to participate in the care of this patient.
