---

UPENDRA SINHA, M.D.  
1314 CONEY ISLAND AVENUE  
BROOKLYN, NY 11230

PATIENT: NAGEENA SULTAN  
DOB: 01/06/1970  
DOS: 12/13/2021  
CHART #: 24086  
EXAM: MRI OF THE LEFT KNEE WITHOUT CONTRAST

HISTORY: Noises heard.

TECHNIQUE: Multiplanar MR imaging of the left knee was performed without contrast on Hitachi open MRI unit.

Coronal PD, T2 and STIR; Sagittal PD and PD fat suppressed; axial T2 and T2 fat suppressed of the knee were obtained.

COMPARISON: None.

Additional sanitizing / safety protocols recommended by the CDC were performed.

FINDINGS: The patellofemoral compartment is unremarkable.

There is no tracking abnormality. There is no chondromalacia. There is a focal contusion overlying the lateral retinaculum.

There is a prominent contusion over the patellar tendon and tibial tuberosity. There is a moderate-to-large joint effusion without evidence of a loose body.

The lateral collateral ligament is unremarkable. There is a grade I injury of the medial collateral ligament. There is subchondral increased T2 signal is seen at the medial femoral condyle. A moderate bone bruise is seen. Slight impaction is questioned at the medial margin. There is a very slight increased T2 signal seen at the medial tibial plateau anteriorly. A focal impaction/fracture is seen noted on image #14 of series #6 and #7.

The PCL is unremarkable. The ACL is intact.

The lateral meniscus is unremarkable. A horizontal tear is seen peripherally at the mid body of the medial meniscus seen on image #7 of series #4. There is no Baker's cyst. There is no muscular injury.
