MRN: 3239527
Acc#: 21725019
DOB: 2/15/1936
Home Phone: (718)723-7880
Exam Date: 8/30/2022 01:45 PM
Exam: CT-LEFT ELBOW NON
CONTRAST | 73200

CT-LEFT ELBOW NON CONTRAST

History: Pain in the left elbow

Comparison Studies: None

Technique: Multislice helical CT imaging of the left elbow was performed, and multiplanar reformat images were created from the primary data sets. This study was performed using automatic exposure control (radiation dose reduction software) to obtain a diagnostic image quality scan with patient dose as low as reasonably achievable. The administered radiation dose was 4.75 mSv.

Findings:

The skin and subcutis are unremarkable.

The visualized neurovascular structures are unremarkable in CT appearance.

Suggestion of partial tearing of the common extensor tendon origin
No joint effusion is visualized.

No bursal effusion is visualized.

No arthritic changes are visualized.

There is no evidence of stress injury, fracture, osteonecrosis or osseous neoplasm.

Bone density is qualitatively normal.

No soft tissue mass is visualized.

No ganglion cyst, abscess, hematoma or other extra-articular fluid collection is visualized.

Exam: CT-LEFT ELBOW NON CONTRAST |
73200

Impression:

1. Suggestion of partial tearing of the common extensor tendon origin. MRI of the elbow can be obtained for further assessment.
2. No fractures.
