Re: Jeanmarie, Chenet
DOB: 05/05/1960
DOA: 08/29/2022

INITIAL ORTHOPEDIC CONSULT EXAMINATION

CHIEF COMPLAINT: Right shoulder, left shoulder, left knee, neck, and low back pain.

HISTORY OF PRESENT ILLNESS: A 62-year-old right-hand dominant male involved in a motor vehicle accident on 08/29/2022. The patient was a front passenger and was wearing a seatbelt. The vehicle was struck on the rear driver side. The airbags did not deploy. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to Long Island Jewish Hospital Center and was treated and released the same day. The patient presents today complaining of right shoulder, left shoulder, left knee, neck, and low back pain sustained in the motor vehicle accident. The patient was attending physical therapy 4 times a week with little relief.

WORK HISTORY: The patient is currently not working.

PAST MEDICAL HISTORY: Noncontributory. There is no previous history of trauma.

PAST SURGICAL HISTORY: Noncontributory.

DRUG ALLERGIES: NO KNOWN DRUG ALLERGIES.

MEDICATIONS: The patient is taking Motrin and Lidocaine gel.

SOCIAL HISTORY: The patient is a nonsmoker. The patient does not drink alcohol. The patient does not use recreational drugs.

ADL CAPABILITIES: The patient states that he can walk for 1/2 block. He can stand for 5 minutes before he has to sit. He can sit for 5 minutes before needing to change positions

secondary to pain. As a direct result of the injuries sustained in this accident, the patient states that he is unable to do the following activities: driving, lifting heavy objects, carrying heavy objects, reaching overhead, laundry, shopping, running errands, kneeling, squatting, negotiating stairs, jogging and exercising.

PRESENT COMPLAINTS: Right shoulder: Right shoulder pain is 6/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness, weakness, popping, and clicking. The patient is unable to reach overhead, unable to reach behind the back, and unable to sleep at night due to pain.

Left shoulder: Left shoulder pain is 9/10, described as constant, sharp, stabbing, dull, achy pain. The patient has weakness, popping, and clicking. The patient is unable to reach overhead, unable to reach behind the back, and unable to sleep at night due to pain.

Left knee: Left knee pain is 9/10, described as constant, sharp, stabbing, dull, achy pain. The patient has stiffness and weakness. The patient has difficulty rising from a chair and has difficulty going up and down stairs. The patient also notes clicking, popping, buckling, and intermittent locking.

REVIEW OF SYSTEMS: Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

General: No fever, chills, night sweats, weight gain, or weight loss.

HEENT: No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

Endocrine: No cold intolerance, appetite changes or hair changes.

Skin: Clear, no rashes or lesions.

Neuro: No headaches, dizziness, vertigo or tremor.

Respiratory: No wheezing, coughing, shortness of breath or difficulty breathing.

Cardiovascular: No chest pain, murmurs, irregular heart rate or hypertension.

GI: No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

GU: No blood in urine, painful urination, loss of bladder control or urinary retention.

Hematology: No active bleeding, bruising, anemia or blood clotting disorders.

Psychiatric: No anxiety, change in sleep pattern, depression or suicidal thoughts.

PHYSICAL EXAMINATION: The patient's height is 5 feet 8 inches, weight is 165 pounds, and BMI is 25.1. The right shoulder reveals tenderness to palpation over AC joint. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative drop arm test. Negative cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Negative Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 140/180 degrees, adduction 40/45 degrees, forward flexion 145/180 degrees, extension 50/60 degrees, internal rotation 70/90 degrees, and external rotation 80/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

The left shoulder reveals tenderness to palpation over supraspinatus tendon region. There is no heat, swelling, erythema, crepitus or deformity appreciated. Negative drop arm test.

Negative cross-over test. Negative empty can test. Negative Yergason test. Negative deltoid atrophy. Negative O'Brien test. Negative impingement sign. Negative Lift-off test. Negative Hawkins test. Range of motion, as per goniometer, abduction 120/180 degrees, adduction 40/45 degrees, forward flexion 110/180 degrees, extension 50/60 degrees, internal rotation 65/90 degrees, and external rotation 75/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the left upper extremity.

The left knee reveals tenderness along the medial joint line. There is no heat, swelling, erythema, crepitus or deformity appreciated. Positive McMurray test. Negative Lachman test. Negative patellofemoral grinding test. Negative anterior drawer. Negative posterior drawer. Range of motion reveals flexion 110/130 degrees and extension 0/5 degrees. Knee is stable with varus and valgus stress test. The patient has no motor or sensory deficit of the left lower extremity.

DIAGNOSTIC TESTING: MRI of the right shoulder, done on 09/25/2022, shows diffusely heterogeneous and T1 depressed marrow signal, which is likely related to a hematologic dyscrasia. Recommend correlation with lab values. Tear at the base of the posterior superior to posterior glenoid labrum. Supraspinatus and infraspinatus tendinitis. No rotator cuff tear. MRI of the left knee, done on 09/25/2022, shows diffusely heterogeneous and T1 depressed marrow signal, which is likely related to a hematologic dyscrasia. Recommend correlation with lab values. Focal undersurface tear at the medial meniscal body. Small popliteal cyst. Patellar tendinitis.

ASSESSMENT:

1. M24.811 Internal derangement, right shoulder.
2. M75.01 Adhesive capsulitis, right shoulder.
3. M75.41 Impingement, right shoulder.
4. M25.511 Pain, right shoulder.
5. S49.91XA Injury, right shoulder.
6. M25.411 Joint effusion, right shoulder.
7. M24.812 Internal derangement, left shoulder.
8. M75.02 Adhesive Capsulitis, left shoulder.
9. M75.42 Impingement, left shoulder.
10. M25.512 Pain, left shoulder.
11. S49.92XA Injury, left shoulder.
12. S83.242A Medial meniscus tear, left knee.
13. M23.92 Internal derangement, left knee.
14. M25.462 Joint effusion, left knee.
15. M12.569 Traumatic arthropathy, left knee.
16. S80.912A Injury, left knee.
17. M25.562 Pain, left knee.

PLAN:

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.

3. Cold compresses for right shoulder, left shoulder, and left knee.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for right shoulder, left shoulder, and left knee 3 days/week.
6. Discussed left knee arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.
7. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other left knee pathology in quantitative and qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.
8. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
9. All the benefits and risks of the left knee arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
10. All the questions in regard to the procedure were answered.
11. The patient verbally consents for the arthroscopy of left knee and the patient will be scheduled for left knee surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon.
12. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

CAUSALITY: It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

AFFIRMATION: Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
