MRI OF THE LEFT ANKLE WITHOUT CONTRAST

INDICATION: Pain

TECHNIQUE: T1, T2, and STIR weighted sequences were obtained.

COMPARISON: No prior studies were available for comparison at the time of dictation.

FINDINGS:

Bone contusion with moderate bone edema of the medial talar head. The ankle mortise is intact, without widening. The distal tibiofibular syndesmosis is intact. No osteochondral lesion. Normal articular cartilage. No coalition. The bone marrow signal is normal.

Achilles tendon is intact. Tenosynovitis of the posterior tibial tendon. The flexor digitorum longus tendon is normal. Flexor hallucis longus tendon is normal. Extensor tendons are intact. Tenosynovitis of the peroneus brevis and longus tendons.

Partial tear and sprain of the ATFL. The posterior talofibular ligament is intact. Deltoid ligament is intact. The syndesmotic ligaments are intact. Partial tear, thickening, and sprain of the calcaneofibular ligament with reactive bone edema at the calcaneal insertion.

Small joint effusion. Subcutaneous edema at the lateral ankle. No plantar fasciitis. Normal sinus Tarsi. No muscle edema.

IMPRESSION:

- Bone contusion with moderate bone edema of the medial talar head.
- Tenosynovitis of the posterior tibial tendon. Tenosynovitis of the peroneus brevis and longus tendons.
- Partial tear and sprain of the ATFL.
- Partial tear, thickening, and sprain of the calcaneofibular ligament with reactive bone edema at the calcaneal insertion.
- Small joint effusion. Subcutaneous edema at the lateral ankle.
