PATIENT: MORENO ROMERO SANTIAGO
EXAM: MRI OF THE LEFT SHOULDER

Dear Dr. Touliopoulos:

Your patient, Moreno Romero Santiago, had an MRI examination of the left shoulder without contrast performed on 03/11/2019.

CLINICAL HISTORY: Shoulder pain since injury.

TECHNIQUE: MRI of the left shoulder was performed utilizing a standard imaging protocol on a Siemens 1.5T MRI unit.

FINDINGS: Multiplanar and multisequence MRI of the left shoulder is performed and reviewed.

Bone marrow signal is within normal limits. There is no evidence of bone marrow edema or fracture. There is no evidence of dislocation.

The acromioclavicular joint is unremarkable. There is no evidence of shoulder separation.

Examination of the glenohumeral joint demonstrates an intact glenoid labrum. The articular cartilage is normal. The biceps anchor and biceps tendons are normal. There is no evidence of an acute ligamentous injury.

Subchondral cysts are seen at the insertion of the infraspinatus tendon.

Some fluid is present within the subacromial/subdeltoid bursa.

The muscles and tendons of the rotator cuff demonstrates normal signal and configuration.

IMPRESSION:

1. SUBACROMIAL/SUBDELTOID BURSITIS.
2. SUBCHONDRAL CYSTS AT THE INSERTION OF THE INFRASPINATUS TENDON.

Thank you for referring this patient to us.
