MRN: LeiJ5914

**RIGHT SHOULDER MRI WITHOUT CONTRAST**

**HISTORY:** Right shoulder pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**ROTATOR CUFF:** There is an interstitial tear at the attachment of the infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. The subscapularis and teres minor tendons are intact.

**MUSCLES:** No muscle edema or fatty muscle atrophy. There is a 16 x 13 mm delaminating cyst within the supraspinatus muscle.

**AC JOINT:** There is moderate acromioclavicular joint disease with capsular thickening and marginal osteophytes which exert mass-effect on the supraspinatus myotendinous junction. There is additional subacromial spurring which contributes to rotator cuff impingement.

**BICEPS TENDON:** Intact long head of the biceps tendon.

**LABRUM/LIGAMENTS:** There is a tear of the posterior superior to posterior glenoid labrum best seen on images 8–10 of the axial oblique series 4.

**GLENOHUMERAL CARTILAGE:** Intact articular cartilage.

**SYNOVIUM/JOINT FLUID:** No joint effusion or synovial thickening.

**MARROW:** Normal marrow signal.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Tear of the posterior superior to posterior glenoid labrum.

Interstitial tear at the attachment of the infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. A 16 x 13 mm delaminating cyst is noted within the supraspinatus muscle.

Evidence of rotator cuff impingement secondary to subacromial spurring and moderate acromioclavicular joint disease.
