UPENDRA SINHA, M.D.
1314 CONEY ISLAND AVENUE
BROOKLYN, NY 11230

PATIENT: RODOLFO ESTEBAN TAVAREZ RAMOS
DOB: 10/22/1973
DOS: 10/05/2021
CHART #: 23764
EXAM: MRI OF THE RIGHT HIP WITHOUT CONTRAST

HISTORY: Difficulty sitting, squatting, standing.

TECHNIQUE: Multiplanar MR imaging of the right hip was performed without contrast on Hitachi open MRI unit.

Coronal T1 weighted images, axial proton density and T2 weighted images and coronal STIR images, Coronal, axial and sagittal T2 oblique of the hip were obtained without contrast.

COMPARISON: None.

FINDINGS: There is no fracture. There is no evidence of impingement. There is slight asymmetry of the pelvis, which may be positional with relative cranial elevation of the right hemipelvis. This could be related to scoliosis, leg-length discrepancy or pain level. Moderate tendinopathy changes are seen distally at the gluteus medius tendon. A focal tear measuring 3 x 3 mm is noted. There is no attenuation. Anterior and posterior labra appear intact. A focal tear is noted at the superior labrum anteriorly at the base. There is no attenuation. There is likely a moderate left-sided hydrocele of the scrotum.

IMPRESSION:

1. TENDINOPATHY CHANGES ARE SEEN AT THE GLUTEUS MEDIUS TENDON. THERE IS LIKELY A FOCAL PARTIAL-THICKNESS TEAR AT THE ANTERIOR MARGIN.
2. A FOCAL TEAR IS SEEN AT THE BASE OF THE SUPERIOR LABRUM AT THE ANTERIOR MARGIN.
3. LEFT-SIDED SCROTAL HYDROCELE IS NOTED, INCOMPLETELY SEEN.

Thank you for referring this patient to us.
