PATIENT: GREEN, ALEXANDER
FILE#: 044959
DOB: 03/29/1989
DOS: 07/26/2022
PHYSICIAN: DR. KOPACH, ALEKSANDR

MRI OF THE LEFT SHOULDER

Clinical History: Pain; s/p injury.

Protocol: T1 and T2 axial and sagittal images

Findings: The acromioclavicular joint is intact. There is no fracture or edema of the distal clavicle. There is a down sloping acromion process impinging upon the supraspinatus muscle tendon complex.

There is tendinosis of the supraspinatus and infraspinatus tendons. There is focal fraying of the distal bursal surface of the supraspinatus tendon near the attachment site consistent with partial tear. The subscapularis tendon is intact.

There is fluid present in the subacromial/subdeltoid bursa. There is a glenohumeral joint effusion collecting in the axillary recess and effacing the inferior glenohumeral ligamentous complex.

There is no humeral head fracture or bone marrow edema. The long head of the biceps tendon is normally situated in the bicipital groove with surrounding fluid.

The anterior and posterior labrum are intact. The visualized musculature is normal in signal intensity.

IMPRESSION:

1. INTACT ACROMIOCLAVICULAR JOINT WITH LOW LYING ACROMION PROCESS IMPINGING UPON THE SUPRASPINATUS MUSCLE TENDON COMPLEX.
2. TENDINOSIS AND PARTIAL TEAR OF THE BURSAL SURFACE OF THE DISTAL SUPRASPINATUS TENDON WITH INTRAARTICULAR JOINT EFFUSION.
3. NO ACUTE FRACTURE OR LABRAL TEAR.

Thank you for the courtesy of this referral.
