PATIENT NAME:	CAMILLE RHODES
REFERRING PHYSICIAN:	JORDAN FERSEL
SERVICE:	MRI RIGHT SHOULDER
DATE OF SERVICE:	10/25/2022

MRI SCAN OF THE RIGHT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right shoulder was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. No appreciable impingement is demonstrated.

There is minimal fluid in the subdeltoid bursa and mild to moderate fluid in the joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

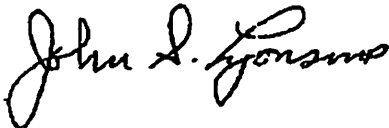

IMPRESSION:

Findings compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis as discussed in the body of the report.

The visualized portions of the labrum are unremarkable.

The osseous structures appear intact.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
