UPENDRA SINHA, M.D.
1314 CONEY ISLAND AVENUE
BROOKLYN, NY 11230

PATIENT: KOBIL HAMIDOV
DOB: 08/08/1986
DOS: 10/13/2021
CHART #: 23794
EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Shoulder pain, limited motion.

COMPARISON: None.

Additional sanitizing / safety protocols recommended by the CDC were performed.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

FINDINGS: Mild tendinitis changes are seen at the supraspinatus and infraspinatus tendons. There is slight irregularity of the bursal surface anteriorly at the supraspinatus tendon. There is a focal contusion over the upper deltoid musculature anteriorly.

Subscapularis and teres minor tendons are intact.

There is no evidence of tear of the subscapularis tendon. There is trace joint fluid, which appears to be physiologic.

There is no muscular atrophy or injury. There is a type I acromion. There is no impingement.

The glenoid is unremarkable. There is no subluxation.

There is no fracture. There is no bone bruise. There is no osteochondral defect.

The superior labrum and biceps anchor are unremarkable. There is no biceps tendon tear or tenosynovitis. The transverse humeral ligament is unremarkable.

The anterior and posterior labra are intact.

EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

PAGE 2

There is no hematoma or seroma. There is no AC separation.

IMPRESSION:

1. A FOCAL SOFT TISSUE CONTUSION IS SEEN ANTERIORLY AT THE PROXIMAL DELTOID MUSCULATURE, AS NOTED. THERE IS NO HEMATOMA OR SEROMA.
2. TENDINITIS CHANGES ARE SEEN AT THE SUPRASPINATUS AND INFRASPINATUS TENDONS. A BURSAL SURFACE TEAR IS SEEN ANTERIORLY AT THE SUPRASPINATUS TENDON.

Thank you for referring this patient to us.
